Command Centre MVP Checklist (Revised)

Differentiators

- Named expert credibility layer: Every plan surfaces the contributing expert's name and credential alongside their protocol and coaching tip. This must be preserved in the UI — it is a trust and differentiation driver, not decorative.
- Proprietary Power Pillar framework: The four-pillar structure (Power Up / Power Through / Power Down / Empower) is the brand's intellectual property and must be visually and structurally present throughout the app experience — not buried.
- Goal category roadmap architecture: The platform must be built to add new goal categories over time (Impact & Influence, Emotional Resilience, Managing Stress & Anxiety, Energy Management & Boundaries, Emotional Intelligence, and others) without rebuilding the logic engine. Extensibility of the goal category and module tagging system is a core architectural requirement.
- Live event integration pipeline: Command Centre clients are a warm pipeline for She Commands retreats and live experiences. The platform should be able to flag users who complete plans or express interest in deeper support, and surface them as event leads.

1. Conversational Intake (Not Just a Form)

Design the questionnaire to feel like a personalization experience, not a data grab

— borrowing Noom's onboarding best practices:

- Tell the user why you're asking each question (one sentence of context per question block).
- Progress bar visible throughout.
- Short, single-idea questions — conversational, not clinical.
- Mix of question styles to reduce fatigue (multiple choice, scale, free text).
- Positive reinforcement responses after key inputs (e.g., "That's a meaningful goal — here's how we'll approach it").

Captures: goal intent + category, lead time, days/hours available, intensity,

limitations/preferences, self-directed vs. coach-guided, current regimen,

city/province.

2. Rule-Based Auto-Mapping (as before)

- Goal category → module pool.
- Lead time → plan type (weekly / bi-weekly / monthly).

- Intensity + availability → protocol filter.
- Minimum one protocol per Power Pillar.
- Outputs a structured execution plan.

3. The Plan (Must-Haves — unchanged from prior version)

The five things that justify Command Centre premium over membership:

- Personalized goal statement and expected outcomes drawn from intake + module library.
- Multi-disciplinary protocol mix across all four Power Pillars — fitness, nutrition, mindset, leadership/presence in one integrated weekly plan.
- Time-based weekly schedule tailored to their available days and hours.
- Named coach tips from selected modules, attributed to the relevant expert (Paula, Andrea, Jenna).
- Access to async coach support (see below) — membership tier does not have this.

4. Async Coach Support (Two Layers — MVP)

Layer 1: AI Chatbot (Always-On)

- A simple chatbot available inside the Command Centre experience.
- Answers questions about the plan: what a protocol means, how to modify it, when to do it.
- Draws from module content and protocol descriptions.
- Responds to general questions about Power Pillars, goal categories, and programme principles.
- Does not provide personalized health or medical advice.

Layer 2: Human Coach Escalation (Limited and Defined)

- Members can flag a message for human coach review when the chatbot is insufficient.
- Coach responds asynchronously within a defined window (e.g., within 48 hours, weekdays only) — following Noom's model of coaches not proactively reaching out.
- Scope is limited and clearly communicated at onboarding:
    - Plan clarification and modifications.
    - Motivation and accountability nudges.
    - Guidance on which protocol to prioritize given a specific upcoming moment.
- Not: personalized medical/nutritional/fitness advice or open-ended life coaching.
- Capacity-cap the number of active Command Centre clients to what your coach network can realistically support at this human-escalation ratio.

5. Community: Goal-Based Cohort Groups (MVP)

Drawing on Noom's group structure:

How to organize cohorts:

- Groups are formed based on primary goal category selected at intake (e.g., a Commanding Presence cohort, a Decision-Making & Taking Action cohort).
- Secondary filter: lead time / plan type (short-term vs. long-term planners have different mindsets and needs).
- Optional tertiary filter from questionnaire data: career stage, context (e.g., executive, entrepreneur, returning to workforce) — this creates more resonant peer groups without over-fragmenting at low member volumes.

Group structure (MVP):

- Small cohorts: 8–15 members per group (Noom's model; small enough for real connection).
- Each group has one assigned coach (one of your expert contributors or a trained facilitator).
- Coach's role: spark weekly discussions, keep conversations focused and constructive, moderate, and surface common themes back to you for content development.
- Members: share wins, challenges, and weekly progress using a simple prompt.
- Platform: this can start as a private community platform (Circle, Geneva, or a private Facebook Group per cohort) — does not need to be custom-built at MVP.

Weekly rhythm inside a cohort group:

- Coach posts one discussion prompt aligned to the current plan week and goal category.
- Members respond in their own time (async).
- Coach responds to threads and highlights notable exchanges.
- One structured "check-in" prompt per week: e.g., "What's the one moment this week where you felt most in command?"

6. Feedback Loop (MVP — unchanged)

- Mid-plan: "Was this week doable?" (one question, in-chat or email).
- Post-plan survey: 2–3 questions on what changed, what was hardest, what they want next.
- Coach-level debrief: coach shares qualitative themes from their cohort group — feeds plan refinement and future content.

7. Positioning — Updated

Add to the Command Centre positioning:

Feature	Membership	Command Centre
Content access	Module library by category	Personalized multi-disciplinary plan
Scheduling	None	Day-by-day weekly schedule
Goal specificity	Category-level	Your goal + your timeline
Power Pillar coverage	Self-directed	All four, built in
Expert coaching	Module-level tips	Named coach tips matched to your modules
Coach support	None	Async chatbot + human coach escalation
Community	General membership space	Small goal-based cohort with assigned coach
Feedback loop	Clinic + community	Mid-plan + post-plan surveys

---

Command Centre Enhancements Backlog (Revised)

Coaching and support

- Proactive coach check-ins triggered by inactivity (e.g., no protocol logged for 5+ days).
- Coach-initiated motivational nudges timed to plan milestones.
- Expanded chatbot scope: NLP-driven responses that adapt to user language and goal context.
- Goal Specialist model: dedicated 1:1 assigned human coach per member (not just group-level), replicating Noom's Goal Specialist layer for a premium sub-tier.

Community

- Cross-cohort events: occasional group sessions where two cohorts interact (e.g., Commanding Presence + Impact & Influence).
- Member-led sub-groups within cohorts based on shared context (e.g., "Founders" pod, "Return to Work" pod).
- Public success stories surfaced from cohort group wins (anonymized, with permission) feeding into free tier newsletter.
- Supportive partner/accountability pair matching within cohorts.

Plan personalization and complexity

- NLP goal categorization (free text → auto-category).
- Machine learning on completion patterns for adaptive plan intensity.
- Bespoke plan tier for high-complexity goals (perimenopause, executive presentation prep, career transition).
- Command Coins: gamified milestone rewards inside the plan experience.
- Progress tracking dashboard: protocol completion, streak tracking, Command Coin balance.

Platform

- Custom app or fully integrated dashboard (Phase 3).
- Push notification reminders tied to the daily schedule.
- Video library for protocol delivery.
- Exportable progress reports and certificates.

She Commands — Command Centre: Developer Brief

Document Purpose: Product brief for developer discovery meeting
Prepared by: She Commands / Myra Reisler
Date: April 1, 2026
Version: MVP Scope (Phase 1)

---

1. Product Overview

She Commands is a women's leadership and lifestyle brand that helps ambitious women perform at their peak in high-stakes professional and personal moments. The Command Centre is the top-tier digital product — a personalized goal execution platform that generates a custom multi-disciplinary plan for each user based on their specific goal, timeline, and constraints.

The platform integrates four domains — fitness, nutrition, mindset, and leadership/presence — into a single weekly execution plan. This is not a content library or a course platform. It is a plan generation and delivery engine supported by async coaching and a goal-based community.

Comparable reference apps (for concept framing):

- Noom — onboarding questionnaire, personalized plan, async coach support, community groups
- Peloton — personalized weekly plan generation based on user inputs
- She Commands differentiator: multidisciplinary (not single-domain), expert coach credibility, power pillar framework, event integration

---

2. Core User Journey (End-to-End)

```text
Intake Questionnaire
        ↓
Auto-Mapping Logic Engine
        ↓
Personalized Execution Plan (delivered digitally)
        ↓
```

```
Async Support (Chatbot + Human Coach Escalation)
        ↓
Goal-Based Cohort Community (assigned coach moderator)
        ↓
Feedback Loop (mid-plan + post-plan) + gamification
        ↓
Plan Renewal / Upsell
```

---

3. Module 1: Intake Questionnaire

Purpose

Collect structured inputs to feed the auto-mapping logic engine and personalize the experience from first touch. Modelled on Noom's onboarding UX — conversational, not clinical.

UX Requirements

- Conversational, mobile-first flow (one question per screen or short grouped screens)
- Progress bar visible throughout
- One sentence of context explaining why each question is being asked
- Positive reinforcement at key input milestones (e.g., "That's a meaningful goal — here's how we'll approach it")
- Completion triggers plan generation flow automatically

Data Fields to Capture

Field	Input Type	Notes
Goal intent	Free text + dropdown selection	User types goal; selects closest goal category from list (helps train model)

Goal category	Single select	Commanding Presence, Decision-Making & Taking Action, Stress & Anxiety, Emotional Resilience, Physical Vitality (more added over time)
Lead time to goal	Single select	≤2 weeks / 3–6 weeks / 7+ weeks
Days per week available	Number selector (1–7)	Drives protocol frequency caps
Hours per day available	Single select	<30 min / 30–60 min / 60+ min
Intensity preference	Single select	Low / Moderate / High
Limitations and preferences	Multi-select + free text	Menopause, injuries, dietary restrictions, etc.
Coaching preference	Single select	Self-directed / Coach-guided
Current fitness regimen	Single select + free text	None / Light / Moderate / Active
Current personal	Single select + free text	None / Some / Active

development regimen		
City / Province / Country	Text / dropdown	For future event targeting and group matching
Feedback interest	Toggle	Yes / No — interest in providing ongoing feedback

---

4. Module 2: Auto-Mapping Logic Engine

Purpose

Transform intake data into a structured execution plan without manual assembly. At MVP this is rule-based (not AI/ML). The architecture must be designed to evolve toward NLP and machine learning in later phases.

Logic Rules (MVP — Rule-Based)

Goal category → module pool selection

- Each goal category has a pre-tagged set of modules in the module library
- System selects from modules tagged to the user's selected goal category

Lead time → plan type

Lead Time	Plan Type	Protocols Per Pillar
≤2 weeks	Weekly Plan	1–2 core protocols per pillar
3–6 weeks	Bi-Weekly Plan	Progression-based protocols

≥7 weeks	Monthly Plan	Full progressions + complementary add-ons
Critical rule	—	System does not generate monthly plans for lead time under 3 weeks

Intensity + availability → protocol filtering

- Available hours/day filters out protocols exceeding session length
- Days/week caps protocol frequency (≤3 days/week = 1 module per pillar)
- Intensity level (Low/Moderate/High) maps to protocol intensity tags in module library

Power Pillar coverage — non-negotiable rule

- Minimum one protocol per Power Pillar in every plan: Power Up / Power Through / Power Down / Empower
- If time constraints prevent this, system flags and asks user to adjust availability inputs

Complementary module inclusion

- If a selected module has complementary module tags AND user has >3 days/week AND <5 modules already selected → auto-include complementary module

Coach tips

- Each selected module has a pre-written coach tip field attributed to a named expert (Paula V / Andrea F / Jenna M)
- System pulls coach tip from each selected module and includes in plan output

Expected outcomes

- Each goal category has pre-written expected outcome statements
- System pulls and includes these in plan header

Module Library Data Structure (existing — to be integrated)

The module library exists as a structured spreadsheet with the following fields per module:

- Module ID, Contributor name, Title, Overview, Core Concepts
- Power Pillar (1–2 per module)
- Goal Category (1–2 per module)

- Outcomes, Protocols (up to 4 per module with steps and prescriptions)
- Modifications, Coach Tip, Sources
- Intensity Level, Time Requirement, Protocol Frequency, Lead Time Fit
- Complementary Module IDs, Module Type (Foundational / Secondary / Assisted / Bespoke)
- Reward Eligible (yes/no), Video Available (yes/no)

Action required from developer: Define database schema and import process for this module library. The tagging schema is the engine core — it must be queryable by all fields listed above.

---

5. Module 3: Execution Plan Output

Purpose

Deliver the personalized plan to the user in a clean, usable digital format. This is the primary value delivery moment.

MVP Plan Components (Required)

1. Goal statement — personalized from intake free text + goal category language
2. Expected outcomes — pulled from goal category presets
3. Power Pillar overview — brief context on which pillars are prioritized and why for this goal
4. Selected modules and protocols — with full protocol steps and prescriptions
5. Named coach tips — attributed to contributor per selected module
6. Time-based weekly schedule — day-by-day layout matching user's available days and hours
7. Modifications — relevant modifications from selected modules (e.g., seated alternatives, menopausal adaptations)

Delivery Format (MVP)

- In-app digital view (mobile-responsive)
- Exportable as PDF (user-initiated)
- Clean, branded layout — designed to be opened on a phone on a Monday morning and followed without friction

Plan Types by Lead Time

- Weekly plan: compact, immediate-impact protocols, 1–2 per pillar

- Bi-weekly plan: progression-based with moderate complexity
- Monthly plan: full progressions with complementary add-ons; most personalised

---

6. Module 4: Async Support

Purpose

Provide on-demand support without requiring synchronous coach availability. Two-layer model modelled on Noom's support architecture.

Layer 1: AI Chatbot (Always-On)

- Available inside the plan view at all times
- Scope: answers questions about the plan (what a protocol means, how to modify it, when to do it); general questions about Power Pillars, goal categories, programme principles
- Draws from module content, protocol descriptions, and goal category definitions
- Does NOT provide personalized medical, nutritional, or fitness advice
- Does NOT have access to other users' data
- Tone: aligned to She Commands brand voice — direct, warm, non-clinical

Layer 2: Human Coach Escalation (Async, Capacity-Capped)

- User can flag a chatbot conversation for human coach review
- Coach responds asynchronously within defined SLA (e.g., 48-hour response, weekdays only)
- Coaches do NOT proactively initiate contact (scalability constraint)
- Defined scope (communicated at onboarding):
    - Plan clarification and protocol modifications
    - Motivation and accountability support
    - Guidance on prioritization given specific upcoming events
    - NOT: open-ended life coaching, medical/nutritional/fitness advice
- Capacity cap: max active Command Centre clients must be set at a number the coach network can support at this escalation rate
- Admin view needed: coach dashboard showing pending escalations, user profile, and plan context

---

7. Module 5: Goal-Based Cohort Community

Purpose

Create meaningful peer connection and group accountability, modelled on Noom's community group structure. Groups are organized by goal context, not randomly.

Cohort Formation Logic

- Primary grouping: goal category selected at intake (e.g., Commanding Presence cohort, Decision-Making cohort)
- Secondary filter: lead time / plan type (short-term vs. long-term planners have different mindsets)
- Optional tertiary filter: career context if captured (e.g., entrepreneurs, executives, return-to-work) — applied only when member volume justifies it
- Target cohort size: 8–15 members (small enough for real connection; Noom best practice)

Coach Assignment Per Cohort

- Each cohort has one assigned coach moderator
- Coach role:
    - Post one weekly discussion prompt aligned to the current plan week and goal category
    - Respond to member threads
    - Keep discussions focused and constructive
    - Surface common themes back to She Commands for content development

Community Platform (MVP)

- Does not need to be custom-built at MVP
- Options: Circle, Geneva, or private community within existing platform
- Must integrate or link cleanly from within the app experience (SSO or seamless handoff preferred)
- Developer to advise on integration options

Weekly Cohort Rhythm

- Weekly prompt posted by assigned coach
- Members respond async
- One structured check-in prompt per week (e.g., "What's one moment this week where you felt most in command?")

---

8. Module 6: Feedback Loop

Purpose

Capture data to validate assumptions, refine plan logic, and improve module selection over time.

MVP Touchpoints

Touchpoint	Timing	Format	Questions
Mid-plan micro-prompt	Halfway through plan period	In-app / email	"Was this week doable?" (1 question)
Post-plan survey	On plan completion	In-app / email	"What changed?", "What was hardest?", "What do you want next?" (2–3 questions)

Success Metrics to Track (MVP)

- Onboarding completion rate (target: 50%)
- Weekly module/protocol views (target: at least 1 per week per user)
- Support requests and escalation volume (target: <25% require human escalation)
- Plan completion rate (target: 20%+)
- Post-plan survey completion rate

---

9. Phase Roadmap

Phase	Timeline	Key Capabilities

Phase 1 — MVP	Now	Digital intake, rule-based auto-mapping, plan delivery, chatbot + human escalation, cohort community (external platform), feedback loop
Phase 2 — Semi-Automated	6–12 months	NLP goal categorization, beta automated module refinement, basic progress tracker, manual Command Coin rewards, expanded goal categories
Phase 3 — Full Platform	12–24 months	AI personalization engine, interactive dashboard, real-time tracking, automated Command Coins, video library, mobile app, push notifications, exportable reports/certificates, API integrations

---

10. Non-Functional Requirements

- Mobile-first: primary use case is a user opening their plan on a phone before starting their day
- Canadian market: data residency considerations if applicable (Myra based in Toronto, ON)
- Privacy: user health and goal data is sensitive — PIPEDA compliance required
- Scalability: architecture must support Phase 2/3 evolution without full rebuild; database and logic layer must be extensible
- Branding: She Commands design system (DIN Condensed Bold for headlines, Manrope Regular for body; brand palette to be provided)
- Integration with existing Squarespace site: seamless handoff from shecommands.ca for signup and payment; developer to advise on architecture

---

11. Open Questions for Developer Discussion

1. What is the recommended tech stack given the Phase 1–3 roadmap (rule-based now → AI/ML later)?
2. How do we handle the module library import and make it queryable at scale?
3. What is the recommended community platform integration approach (Circle / Geneva / custom) given the cohort logic requirements?

4. What is the best chatbot framework for Phase 1 that can evolve into NLP in Phase 2?
5. How do we handle plan versioning — if a user restarts or updates their goal mid-plan?
6. What are the data residency and PIPEDA compliance implications for storing health preference and goal data?
7. What does the coach admin dashboard need to include for Phase 1?
8. Estimated timeline and build phases for MVP delivery?
